

Week 1 Internship Report

Project Title: Diabetes / Heart Disease Risk Predictor

Objective: Build and compare Logistic Regression and Random Forest models on medical datasets to predict disease risk.

Tasks Completed:

- Collected diabetes and heart disease datasets.
- Performed data loading and preprocessing.
- Split data into training and testing sets.
- Implemented Logistic Regression.
- Implemented Random Forest.
- Compared model performance and prepared model saving workflow.

Tools Used: Python, Jupyter Notebook, Pandas, NumPy, Scikit-learn, Matplotlib

Outcome: Successfully trained baseline machine learning models and established the project structure for further development.

Next Week Plan: Improve model performance, save trained models (.pkl), and begin integrating the prediction system into a web application.
